You can use the `expo-constants` package to manage API keys in React Native Expo. This package provides a simple way to access device-specific information, such as the device ID, app name, and app version, as well as the Expo SDK version. You can use this package to store your API keys in a `.env` file and access them in your code using `Constants.manifest.extra`. Here is an example of how you can use this package to store your API keys:

1. Install the `expo-constants` package by running the following command in your project directory:

```
expo install expo-constants
```

2. Create a `.env` file in the root directory of your project and add your API keys as environment variables. For example:

```
API_KEY=your_api_key_here
```

3. In your code, import `Constants` from `expo-constants` and access your API key using `Constants.manifest.extra.API_KEY`. For example:

```
import Constants from 'expo-constants';  
  
const API_KEY = Constants.manifest.extra.API_KEY;
```

I hope this helps! Let me know if you have any other questions.
